

HIV/AIDS ASSOCIATED WITH LICHEN PLANUS, A RARE CASE REPORT

Human Immunodeficiency Virus (HIV) cause critical disorder of immune system which severely damages the body's defense mechanism & become life threatening or fatal. Nowadays it becomes a pandemic infectious disease. Highly active anti-retro viral therapy has made HIV/AIDS a chronic manageable disease. But due to impaired immune mechanism oral lesions are indicative of HIV disease. This article presents cases of erosive lichen planus, superadded candidiasis, and blackish pigmentation on skin in middle aged female patient who are HIV positive.
