

DISCOVERY OF TWO NEW SOLAR MARKERS AT PAINT ROCK, A MAJOR SUN-WATCHING STATION

GORDON L. HOUSTON¹ AND IRAKLI SIMONIA²

Paint Rock is a pictograph site in the state of Texas, USA. The assemblage contains over 1500 pictographs. Between 1996 and 2002 there were six active solar markers discovered. These six solar markers make Paint Rock the most active archaeoastronomical site in the region. It was hypothesized that more solar markers existed. We report on the discovery of two new solar markers. One records the winter solstice and the second records the spring and summer cross-quarter days.
